

The Sequential Rejection Principle

Livio Finos

I thank Aldo Solari, Jelle Goeman and Florian Klinglmueller for the ideas and the materials we shared along these years. The material is the result of all this reasoning together.

The sequential rejection principle

Inheritance procedure

Application: Genomics

Application: Neurotoxicity assay

Familywise Error Rate

$\mathcal{T} \subseteq \mathcal{H}$: set of true null hypotheses

Strong control of the familywise error rate

$$\text{FWE} = \Pr(\text{at least one type I error}) \leq \alpha \quad \forall \mathcal{T} \subseteq \mathcal{H}$$

Multiple testing procedures

- Bonferroni and Holm
- Closed testing
- Gatekeeping
- Stepdown S_{\max}
- ...

Bonferroni and Holm

Bonferroni Inequality

$$\text{FWE} = \Pr \left(\bigcup_{H \in \mathcal{H}} \left\{ p_H \leq \frac{\alpha}{|\mathcal{H}|} \right\} \right) \leq \sum_{H \in \mathcal{H}} \Pr \left(p_H \leq \frac{\alpha}{|\mathcal{H}|} \right) \leq \alpha$$

Holm's sequential procedure

Start at $\alpha/5$

1. Start testing at $\alpha/|\mathcal{H}|$
2. After $|\mathcal{R}|$ hypotheses have been rejected, test at $\alpha/|\mathcal{H} \setminus \mathcal{R}|$
3. Stop at the first failure to reject a hypothesis

Bonferroni and Holm

Bonferroni Inequality

$$\text{FWE} = \Pr \left(\bigcup_{H \in \mathcal{H}} \left\{ p_H \leq \frac{\alpha}{|\mathcal{H}|} \right\} \right) \leq \sum_{H \in \mathcal{H}} \Pr \left(p_H \leq \frac{\alpha}{|\mathcal{H}|} \right) \leq \alpha$$

Holm's sequential procedure

Suppose p_A and p_C significant

1. Start testing at $\alpha/|\mathcal{H}|$
2. After $|\mathcal{R}|$ hypotheses have been rejected, test at $\alpha/|\mathcal{H} \setminus \mathcal{R}|$
3. Stop at the first failure to reject a hypothesis

Bonferroni and Holm

Bonferroni Inequality

$$\text{FWE} = \Pr \left(\bigcup_{H \in \mathcal{H}} \left\{ p_H \leq \frac{\alpha}{|\mathcal{H}|} \right\} \right) \leq \sum_{H \in \mathcal{H}} \Pr \left(p_H \leq \frac{\alpha}{|\mathcal{H}|} \right) \leq \alpha$$

Holm's sequential procedure

Go on at $\alpha/3$

1. Start testing at $\alpha/|\mathcal{H}|$
2. After $|\mathcal{R}|$ hypotheses have been rejected, test at $\alpha/|\mathcal{H} \setminus \mathcal{R}|$
3. Stop at the first failure to reject a hypothesis

Bonferroni and Holm

Bonferroni Inequality

$$\text{FWE} = \Pr \left(\bigcup_{H \in \mathcal{H}} \left\{ p_H \leq \frac{\alpha}{|\mathcal{H}|} \right\} \right) \leq \sum_{H \in \mathcal{H}} \Pr \left(p_H \leq \frac{\alpha}{|\mathcal{H}|} \right) \leq \alpha$$

Holm's sequential procedure

Suppose p_D significant

1. Start testing at $\alpha/|\mathcal{H}|$
2. After $|\mathcal{R}|$ hypotheses have been rejected, test at $\alpha/|\mathcal{H} \setminus \mathcal{R}|$
3. Stop at the first failure to reject a hypothesis

Bonferroni and Holm

Bonferroni Inequality

$$\text{FWE} = \Pr \left(\bigcup_{H \in \mathcal{H}} \left\{ p_H \leq \frac{\alpha}{|\mathcal{H}|} \right\} \right) \leq \sum_{H \in \mathcal{H}} \Pr \left(p_H \leq \frac{\alpha}{|\mathcal{H}|} \right) \leq \alpha$$

Holm's sequential procedure

Go on at $\alpha/2$

1. Start testing at $\alpha/|\mathcal{H}|$
2. After $|\mathcal{R}|$ hypotheses have been rejected, test at $\alpha/|\mathcal{H} \setminus \mathcal{R}|$
3. Stop at the first failure to reject a hypothesis

Bonferroni and Holm

Bonferroni Inequality

$$\text{FWE} = \Pr \left(\bigcup_{H \in \mathcal{H}} \left\{ p_H \leq \frac{\alpha}{|\mathcal{H}|} \right\} \right) \leq \sum_{H \in \mathcal{H}} \Pr \left(p_H \leq \frac{\alpha}{|\mathcal{H}|} \right) \leq \alpha$$

Holm's sequential procedure

No more rejections. Stop

1. Start testing at $\alpha/|\mathcal{H}|$
2. After $|\mathcal{R}|$ hypotheses have been rejected, test at $\alpha/|\mathcal{H} \setminus \mathcal{R}|$
3. Stop at the first failure to reject a hypothesis

Closed Testing

Make use of the dependence structure of test statistics

Closed Testing

1. Make \mathcal{H} closed, i.e.
$$A, B \in \mathcal{H} \Rightarrow AB \equiv A \cap B \in \mathcal{H}$$
2. Start testing the top node
3. At each step, test all child nodes of which all ancestors are significant at α

Starting hypotheses

A

B

C

Closed Testing

Make use of the dependence structure of test statistics

Closed Testing

1. Make \mathcal{H} closed, i.e.

$$A, B \in \mathcal{H} \Rightarrow AB \equiv A \cap B \in \mathcal{H}$$

2. Start testing the top node
3. At each step, test all child nodes of which all ancestors are significant at α

Make \mathcal{H} closed w.r. to intersection

Closed Testing

Make use of the dependence structure of test statistics

Closed Testing

1. Make \mathcal{H} closed, i.e.
 $A, B \in \mathcal{H} \Rightarrow AB \equiv A \cap B \in \mathcal{H}$
2. Start testing the top node
3. At each step, test all child nodes of which all ancestors are significant at α

Start testing the top node at α

Closed Testing

Make use of the dependence structure of test statistics

Closed Testing

1. Make \mathcal{H} closed, i.e.
 $A, B \in \mathcal{H} \Rightarrow AB \equiv A \cap B \in \mathcal{H}$
2. Start testing the top node
3. At each step, test all child nodes of which all ancestors are significant at α

Suppose the top node is significant

Closed Testing

Make use of the dependence structure of test statistics

Closed Testing

1. Make \mathcal{H} closed, i.e.
 $A, B \in \mathcal{H} \Rightarrow AB \equiv A \cap B \in \mathcal{H}$
2. Start testing the top node
3. At each step, test all child nodes of which all ancestors are significant at α

Go down

Closed Testing

Make use of the dependence structure of test statistics

Closed Testing

1. Make \mathcal{H} closed, i.e.
 $A, B \in \mathcal{H} \Rightarrow AB \equiv A \cap B \in \mathcal{H}$
2. Start testing the top node
3. At each step, test all child nodes of which all ancestors are significant at α

Find those are significant

Closed Testing

Make use of the dependence structure of test statistics

Closed Testing

1. Make \mathcal{H} closed, i.e.
 $A, B \in \mathcal{H} \Rightarrow AB \equiv A \cap B \in \mathcal{H}$
2. Start testing the top node
3. At each step, test all child nodes of which all ancestors are significant at α

Go down

Closed Testing

Make use of the dependence structure of test statistics

Closed Testing

1. Make \mathcal{H} closed, i.e.
 $A, B \in \mathcal{H} \Rightarrow AB \equiv A \cap B \in \mathcal{H}$
2. Start testing the top node
3. At each step, test all child nodes of which all ancestors are significant at α

Find those are significant

Example: clinical trial in patients with hypertension

Study design: two doses versus placebo

$X_1, \dots, X_m \stackrel{\text{i.i.d.}}{\sim} N(\psi_x, 1)$ Placebo

$Y_1, \dots, Y_n \stackrel{\text{i.i.d.}}{\sim} N(\psi_y, 1)$ Low dose

$Z_1, \dots, Z_n \stackrel{\text{i.i.d.}}{\sim} N(\psi_z, 1)$ High dose

Primary endpoint: reduction in diastolic blood pressure

$A : \psi_x = \psi_y$ versus $\tilde{A} : \psi_x > \psi_y$

$B : \psi_x = \psi_z$ versus $\tilde{B} : \psi_x > \psi_z$

Statistics: marginal and joint null distributions

$$S_A = \sqrt{\frac{mn}{m+n}}(\bar{X} - \bar{Y}) \stackrel{A}{\sim} N(0, 1)$$

$$S_B = \sqrt{\frac{mn}{m+n}}(\bar{X} - \bar{Z}) \stackrel{B}{\sim} N(0, 1) \quad \begin{pmatrix} S_A \\ S_B \end{pmatrix} \stackrel{A, B}{\sim} N_2 \left(\begin{bmatrix} 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 & \lambda \\ \lambda & 1 \end{bmatrix} \right)$$

$\lambda = \frac{n}{n+m}$ nuisance parameter

Bonferroni's bound: positive dependence

FWE = $\Pr(\{S_A > c\} \cup \{S_B > c\})$ using $c = z_{1-\frac{\alpha}{2}}$ (Bonferroni) is equal

$$\underbrace{\Pr\left(S_A > z_{1-\frac{\alpha}{2}}\right)}_{\alpha/2} + \underbrace{\Pr\left(S_B > z_{1-\frac{\alpha}{2}}\right)}_{\alpha/2} - \underbrace{\Pr\left(\left\{S_A > z_{1-\frac{\alpha}{2}}\right\} \cap \left\{S_B > z_{1-\frac{\alpha}{2}}\right\}\right)}_{\alpha(\lambda)}$$

$n = 3m$, $\lambda = 3/4$,
FWE = 0.04

$0 < \lambda < 1$, \uparrow dose levels

Bonferroni's bound: worst dependence case

Two-sided testing

$$A : \psi = 0 \quad \text{versus} \quad \tilde{A} : \psi > 0$$

$$B : \psi = 0 \quad \text{versus} \quad \tilde{B} : \psi < 0$$

$S_B \equiv -S_A \Rightarrow \lambda = -1$ (disjoint rejection regions)

$$\text{FWE} = \Pr \left(S_A > z_{1-\frac{\alpha}{2}} \right) + \Pr \left(-S_A > z_{1-\frac{\alpha}{2}} \right) = \alpha$$

Stepdown S_{\max} (parametric)

Make use of the dependence structure of test statistics

Stepdown procedure

1. Find the null distribution of $S_{\max} = \max_{H \in \mathcal{H}}(S_H)$
2. Reject H if $S_H > c_{1-\alpha}$, the $(1 - \alpha)$ -quantile of $d_{S_{\max}}$
3. Recompute the distribution of $S_{\max} = \max_{H \in \mathcal{H} \setminus \mathcal{R}}(S_H)$
4. Repeat

Find $c_{1-\alpha}$ from $d_{S_{\max}} = d_{\max}(S_A, S_B)$

$$\begin{array}{l} \mathcal{H} \setminus \mathcal{R} : \quad \begin{array}{cc} c_{1-\alpha} & c_{1-\alpha} \\ \boxed{A} & \boxed{B} \end{array} \\ \mathcal{R} : \end{array}$$

Stepdown S_{\max} (parametric)

Make use of the dependence structure of test statistics

Stepdown procedure

1. Find the null distribution of $S_{\max} = \max_{H \in \mathcal{H}}(S_H)$
2. Reject H if $S_H > c_{1-\alpha}$, the $(1 - \alpha)$ -quantile of $d_{S_{\max}}$
3. Recompute the distribution of $S_{\max} = \max_{H \in \mathcal{H} \setminus \mathcal{R}}(S_H)$
4. Repeat

Suppose $S_B > c_{1-\alpha}$

$$\begin{array}{l} \mathcal{H} \setminus \mathcal{R} : \quad \begin{array}{cc} c_{1-\alpha} & c_{1-\alpha} \\ \boxed{A} & \boxed{B} \end{array} \\ \mathcal{R} : \end{array}$$

Stepdown S_{\max} (parametric)

Make use of the dependence structure of test statistics

Stepdown procedure

1. Find the null distribution of $S_{\max} = \max_{H \in \mathcal{H}}(S_H)$
2. Reject H if $S_H > c_{1-\alpha}$, the $(1 - \alpha)$ -quantile of $d_{S_{\max}}$
3. Recompute the distribution of $S_{\max} = \max_{H \in \mathcal{H} \setminus \mathcal{R}}(S_H)$
4. Repeat

Find $z_{1-\alpha}$ from $d_{S_{\max}} = d_{S_A}$

Stepdown S_{\max} (parametric)

Make use of the dependence structure of test statistics

Stepdown procedure

1. Find the null distribution of $S_{\max} = \max_{H \in \mathcal{H}}(S_H)$
2. Reject H if $S_H > c_{1-\alpha}$,
the $(1 - \alpha)$ -quantile of $d_{S_{\max}}$
3. Recompute the distribution
of $S_{\max} = \max_{H \in \mathcal{H} \setminus \mathcal{R}}(S_H)$
4. Repeat

Suppose $S_A > z_{1-\alpha}$

$\mathcal{H} \setminus \mathcal{R} :$ — —
 $\mathcal{R} :$ A B

Stepdown S_{\max} (resampling based)

Make use of the dependence structure of test statistics

Stepdown procedure

1. Find the null distribution* of $S_{\max} = \max_{H \in \mathcal{H}}(S_H)$
2. Reject H if $S_H > c_{1-\alpha}^*$,
the $(1 - \alpha)$ -quantile of $d_{S_{\max}}^*$
3. Recompute the distribution*
of $S_{\max} = \max_{H \in \mathcal{H} \setminus \mathcal{R}}(S_H)$
4. Repeat

* bootstrap (parametric and non-), permutations

Assumption: "subset pivotality",
exchangeability

Find $c_{1-\alpha}^*$ from $d_{S_{\max}}^* = d_{\max}^*(S_A, S_B)$

$$\begin{array}{cc} c_{1-\alpha}^* & c_{1-\alpha}^* \\ \mathcal{H} \setminus \mathcal{R} : & \boxed{A} \quad \boxed{B} \\ \mathcal{R} : & \end{array}$$

Stepdown S_{\max} (resampling based)

Make use of the dependence structure of test statistics

Stepdown procedure

1. Find the null distribution* of $S_{\max} = \max_{H \in \mathcal{H}}(S_H)$
2. Reject H if $S_H > c_{1-\alpha}^*$,
the $(1 - \alpha)$ -quantile of $d_{S_{\max}}^*$
3. Recompute the distribution* of $S_{\max} = \max_{H \in \mathcal{H} \setminus \mathcal{R}}(S_H)$
4. Repeat

* bootstrap (parametric and non-), permutations

Assumption: "subset pivotality",
exchangeability

Suppose $S_B > c_{1-\alpha}^*$

$\mathcal{H} \setminus \mathcal{R} :$ $\begin{matrix} c_{1-\alpha}^* & - \\ \text{A} & \end{matrix}$
 $\mathcal{R} :$ $\begin{matrix} & \\ & \text{B} \end{matrix}$

Stepdown S_{\max} (resampling based)

Make use of the dependence structure of test statistics

Stepdown procedure

1. Find the null distribution* of $S_{\max} = \max_{H \in \mathcal{H}}(S_H)$
 2. Reject H if $S_H > c_{1-\alpha}^*$, the $(1 - \alpha)$ -quantile of $d_{S_{\max}}^*$
 3. Recompute the distribution* of $S_{\max} = \max_{H \in \mathcal{H} \setminus \mathcal{R}}(S_H)$
 4. Repeat
- * bootstrap (parametric and non-), permutations

Assumption: "subset pivotality", exchangeability

Find $z_{1-\alpha}^*$ from $d_{S_{\max}}^* = d_{S_A}^*$

Stepdown S_{\max} (resampling based)

Make use of the dependence structure of test statistics

Stepdown procedure

1. Find the null distribution* of $S_{\max} = \max_{H \in \mathcal{H}}(S_H)$
 2. Reject H if $S_H > c_{1-\alpha}^*$, the $(1 - \alpha)$ -quantile of $d_{S_{\max}}^*$
 3. Recompute the distribution* of $S_{\max} = \max_{H \in \mathcal{H} \setminus \mathcal{R}}(S_H)$
 4. Repeat
- * bootstrap (parametric and non-), permutations

Assumption: "subset pivotality", exchangeability

Suppose $S_A \leq z_{1-\alpha}^*$. Stop

Outline

Some Multiple Testing Procedures

The sequential rejection principle

Inheritance procedure

Application: Genomics

Application: Neurotoxicity assay

All similar methods

1. Start testing hypotheses at some significance criterion
2. If any hypotheses rejected, set new significance criterion for unrejected hypotheses
3. Possibly new rejections
4. Stop if no new rejections occur

Are these all examples of the same procedure?

The general procedure

$\mathcal{R}_i \subseteq \mathcal{H}$: the rejected hypotheses after step i

$$\begin{aligned}\mathcal{R}_0 &= \emptyset \\ \mathcal{R}_{i+1} &= \mathcal{R}_i \cup \{H \in \mathcal{H} : S_H > c_H(\mathcal{R}_i)\}\end{aligned}$$

After every step the procedure adjusts the critical values on the basis of the new rejected set

The Sequential Rejection Principle

Theorem¹

If a general sequentially rejective procedure fulfills two conditions

1. Monotonicity
2. Single step control

Then it controls the FWE

Monotonicity condition: for every $\mathcal{S} \subseteq \mathcal{R} \subset \mathcal{H}$ and every $H \in \mathcal{H} \setminus \mathcal{R}$,

$$c_H(\mathcal{S}) \geq c_H(\mathcal{R})$$

In words: critical values of unrejected null hypotheses never increase with more rejections

Note: monotonicity implies $c_H(\mathcal{R}_i) \geq c_H(\mathcal{R}_{i+1})$, but this is too weak to guarantee FWE control

¹J.J. Goeman and A. Solari (2008) The sequential rejection principle of familywise error control. *Submitted*

The Sequential Rejection Principle

Theorem¹

If a general sequentially rejective procedure fulfills two conditions

1. Monotonicity
2. Single step control

Then it controls the FWE

Single step condition: for every $\mathcal{R} \subset \mathcal{H}$ and $\mathcal{T} = \mathcal{H} \setminus \mathcal{R}$,

$$\Pr \left(\bigcup_{H \in \mathcal{T}} \{S_H > c_H(\mathcal{R})\} \right) \leq \alpha$$

In words: FWE weak control is guaranteed at each single step. It may be assumed that all previous rejections were correct rejections

¹J.J. Goeman and A. Solari (2008) The sequential rejection principle of familywise error control. *Submitted*

The Sequential Rejection Principle

Theorem¹

If a general sequentially rejective procedure fulfills two conditions

1. Monotonicity
2. Single step control

Then it controls the FWE

¹J.J. Goeman and A. Solari (2008) The sequential rejection principle of familywise error control. *Submitted*

The Sequential Rejection Principle

Theorem¹

If a general sequentially rejective procedure fulfills two conditions

1. Monotonicity
2. Single step control

Then it controls the FWE

A unifying approach:

- Facilitates formulation of FWE controlling procedures
- Facilitates proof of FWE control
- Makes connections between methods more obvious

¹J.J. Goeman and A. Solari (2008) The sequential rejection principle of familywise error control. *Submitted*

Self Report psychological/sociological questionnaires

- investigated concepts
- different aspects
- single items (questions)

Alternative

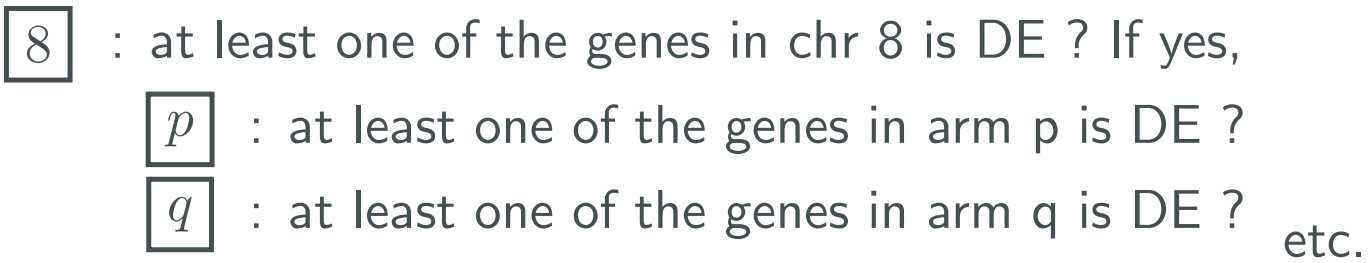

Make a tree structure from the data by hierarchical clustering

Example of Tree-Structured Hypotheses: Genes

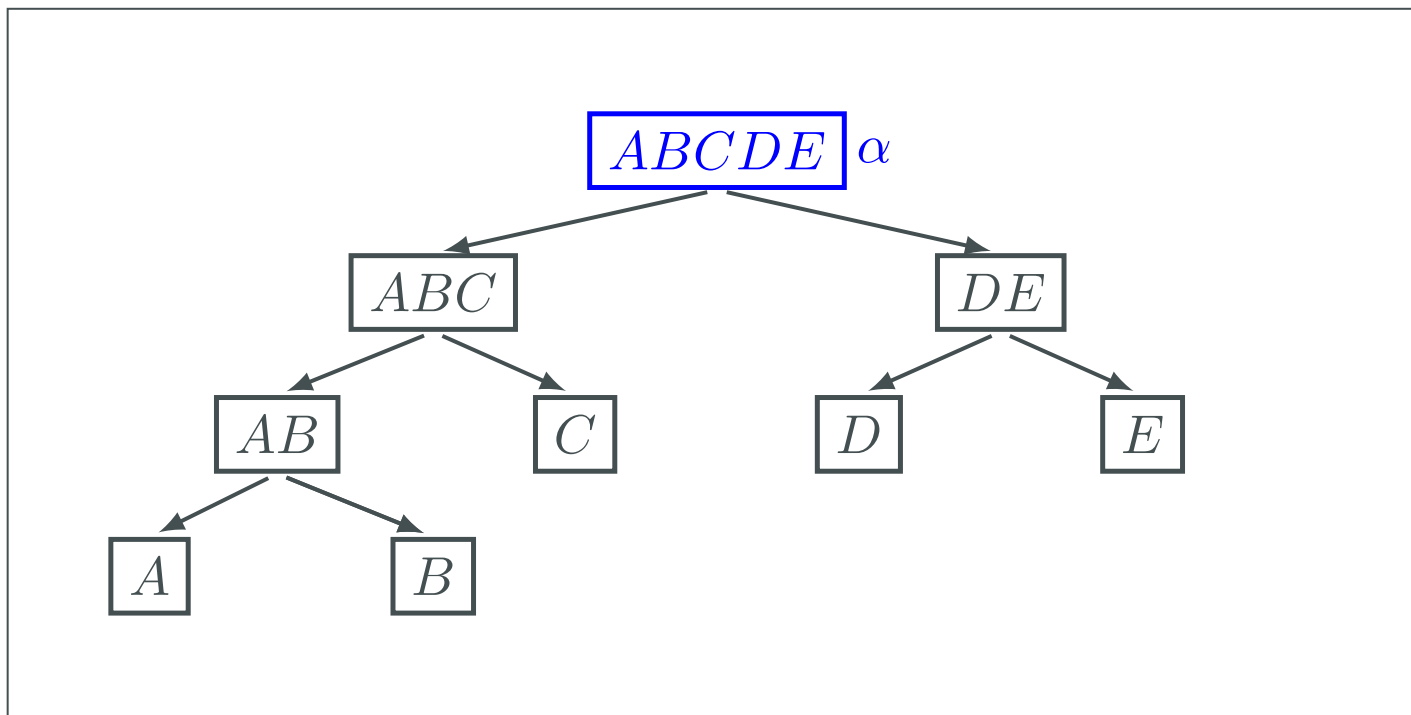

root = general question, ↓ = more specific follow-up questions

Meinshausen's procedure (BMK 2008)

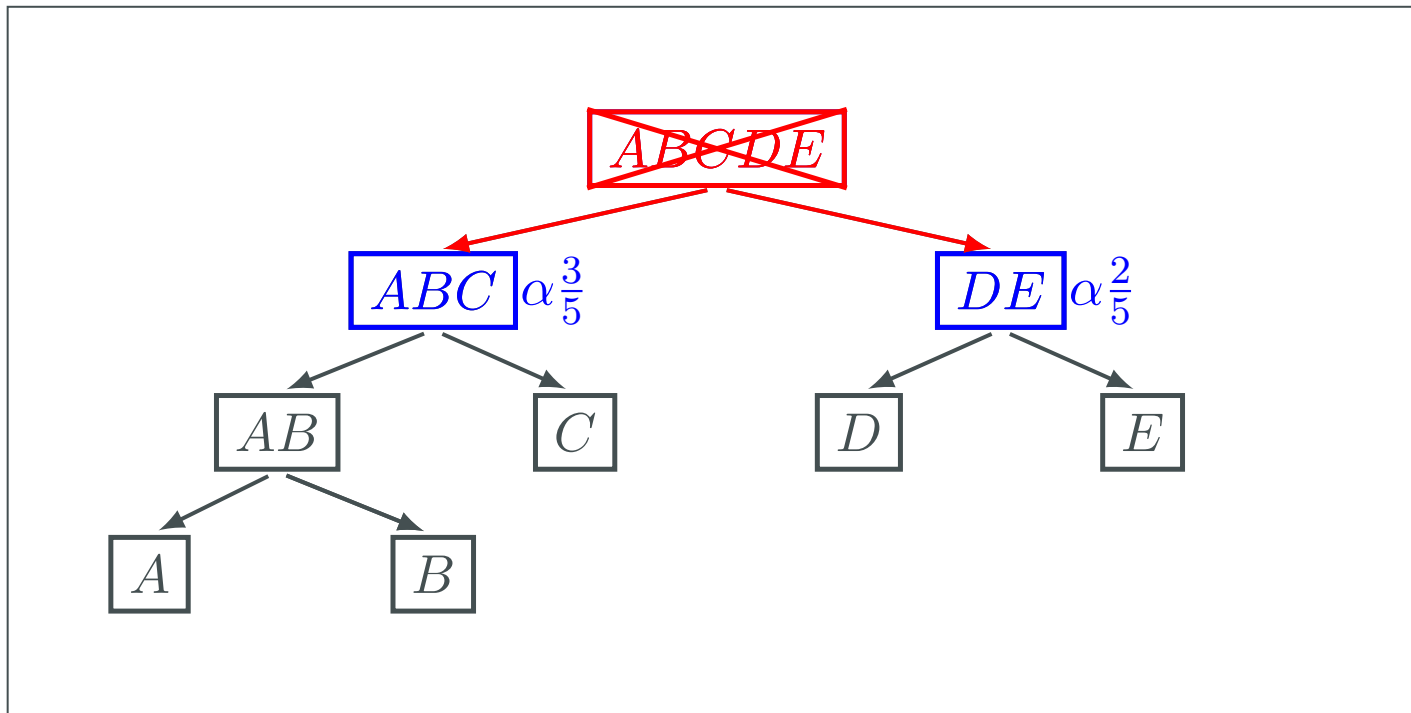

start from the top:

test $ABCDE$ at level α

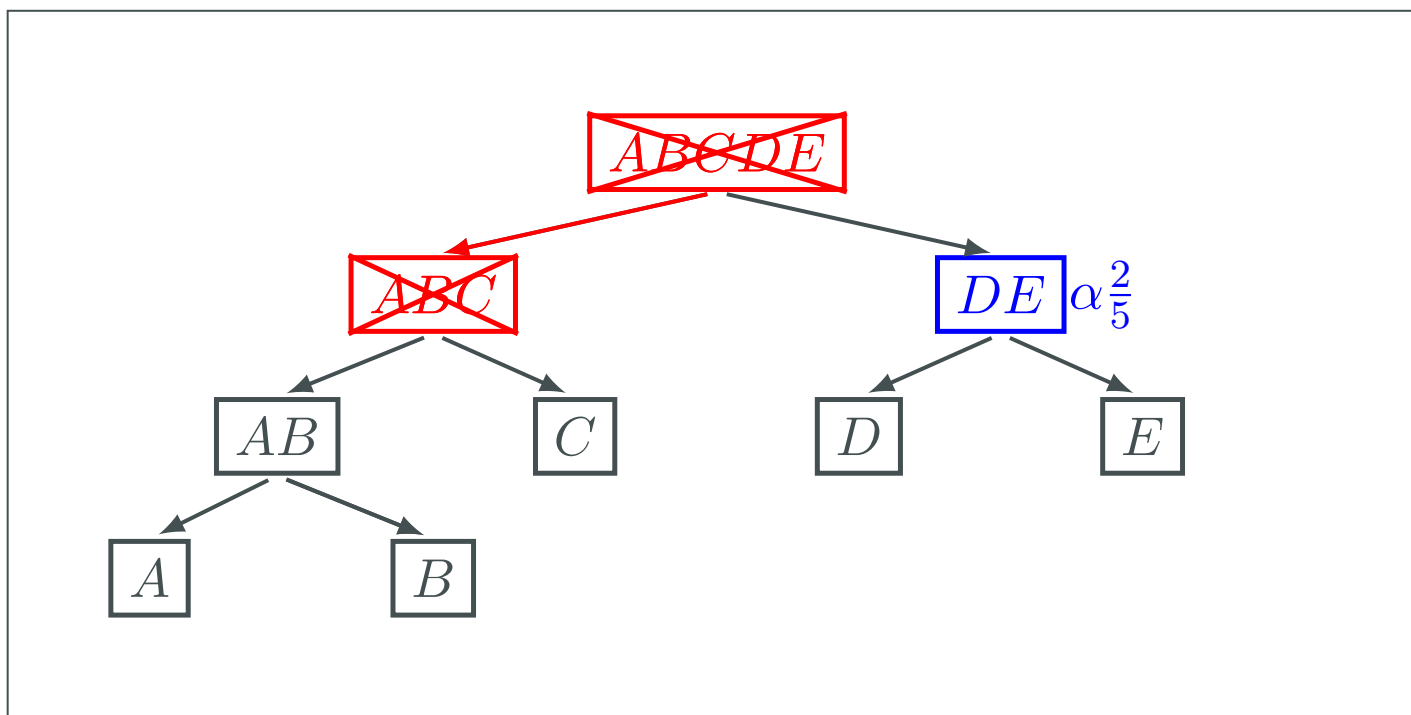

Meinshausen's procedure (BMK 2008)

suppose $p_{ABCDE} \leq \alpha$,
test ABC at $\frac{3}{5}\alpha$ and DE at $\frac{2}{5}\alpha$

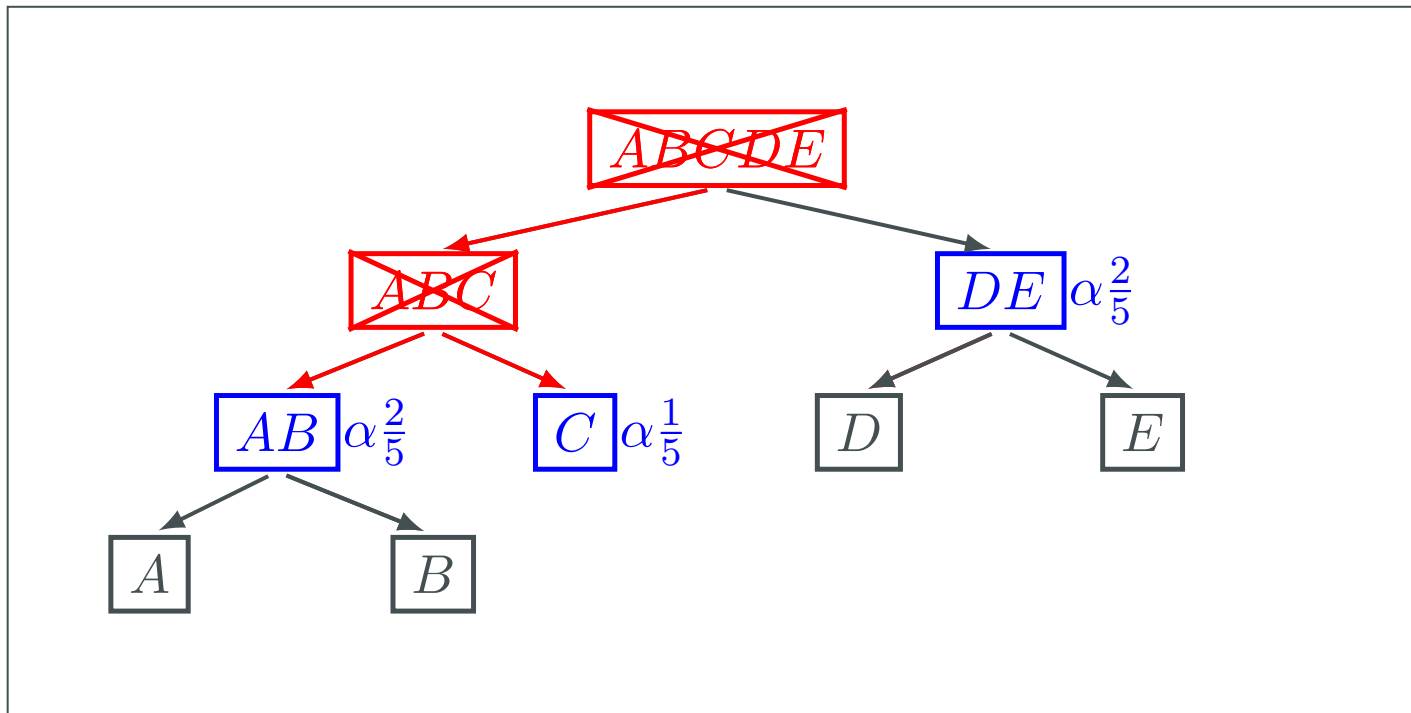

Meinshausen's procedure (BMK 2008)

suppose $p_{ABC} \leq \frac{3}{5}\alpha$ and $p_{DE} > \frac{2}{5}\alpha$

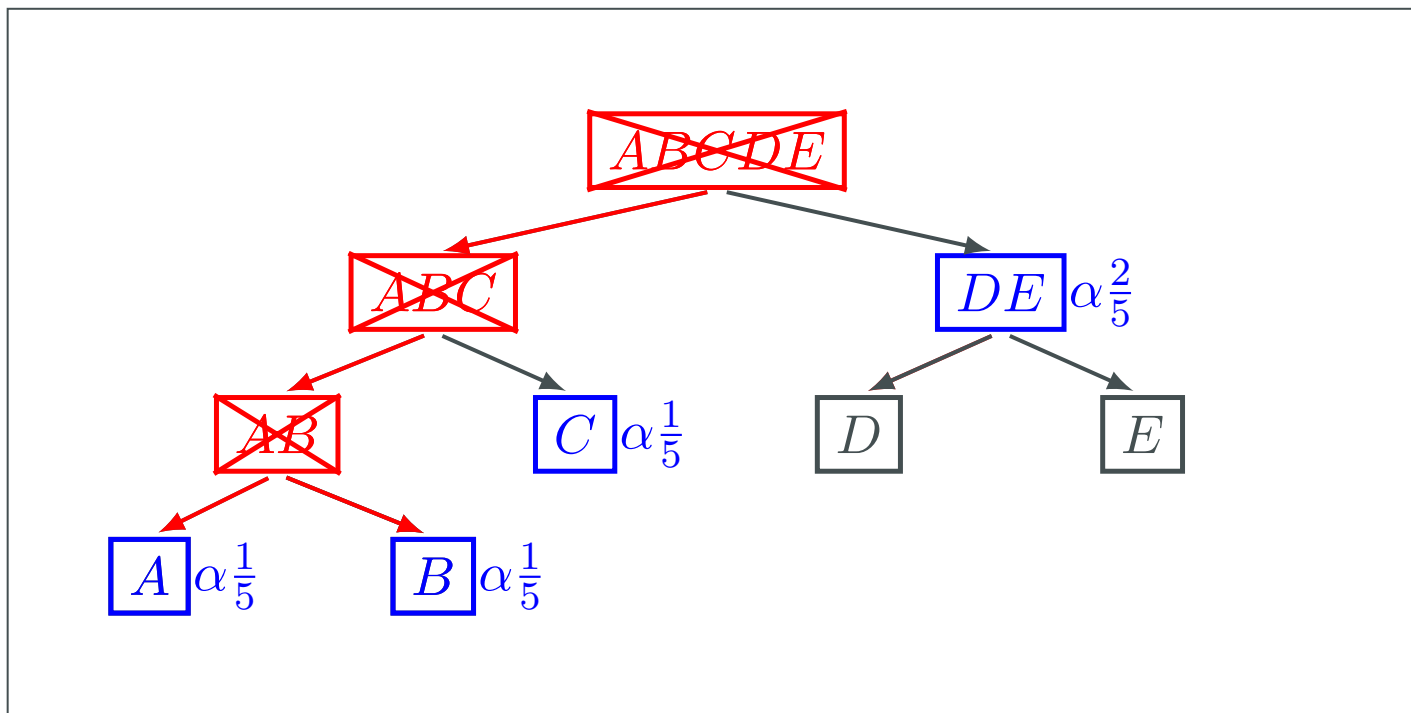

Meinshausen's procedure (BMK 2008)

test AB at $\frac{2}{5}\alpha$ and C at $\frac{1}{5}\alpha$

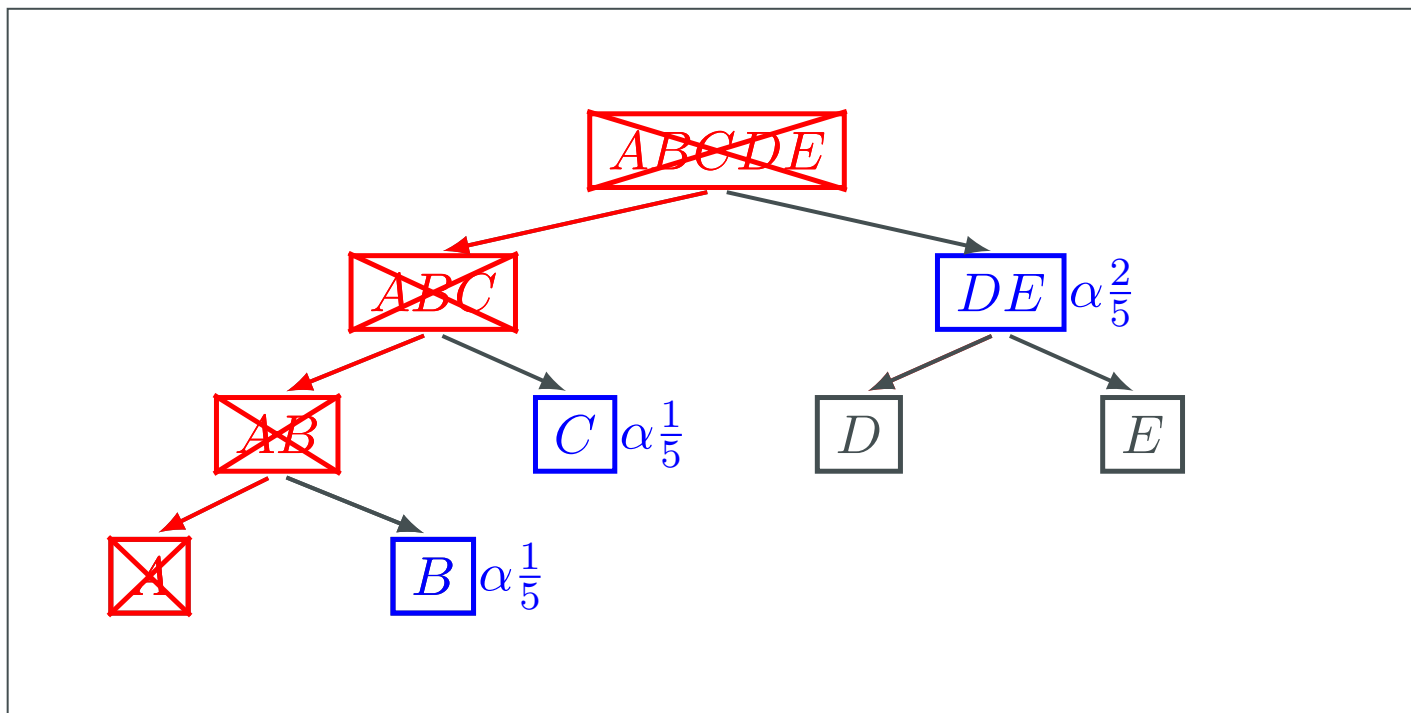

Meinshausen's procedure (BMK 2008)

suppose $p_{AB} \leq \frac{2}{5}\alpha$ and $p_C > \frac{1}{5}\alpha$,
test A at $\frac{1}{5}\alpha$ and B at $\frac{1}{5}\alpha$

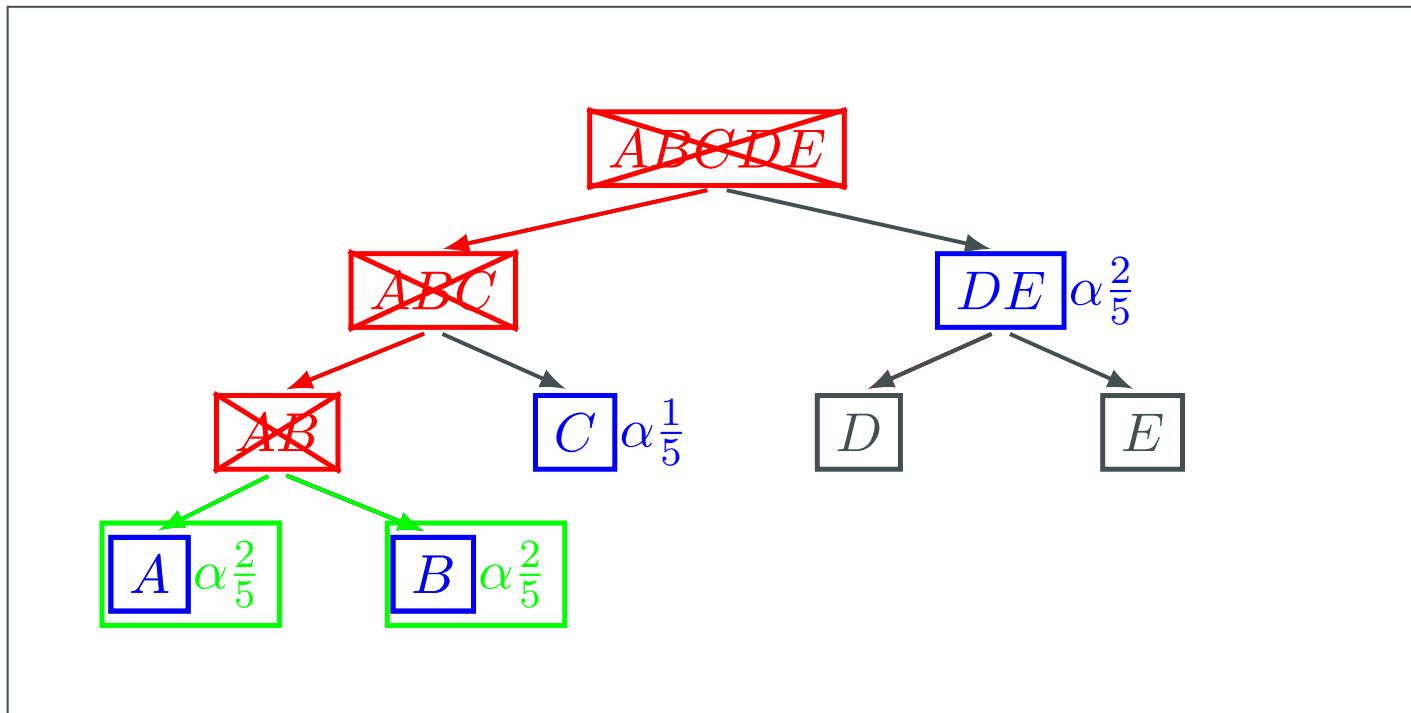

Meinshausen's procedure (BMK 2008)

suppose $p_A \leq \frac{1}{5}\alpha$ and $\frac{1}{5}\alpha < p_B < \frac{2}{5}\alpha$
STOP?

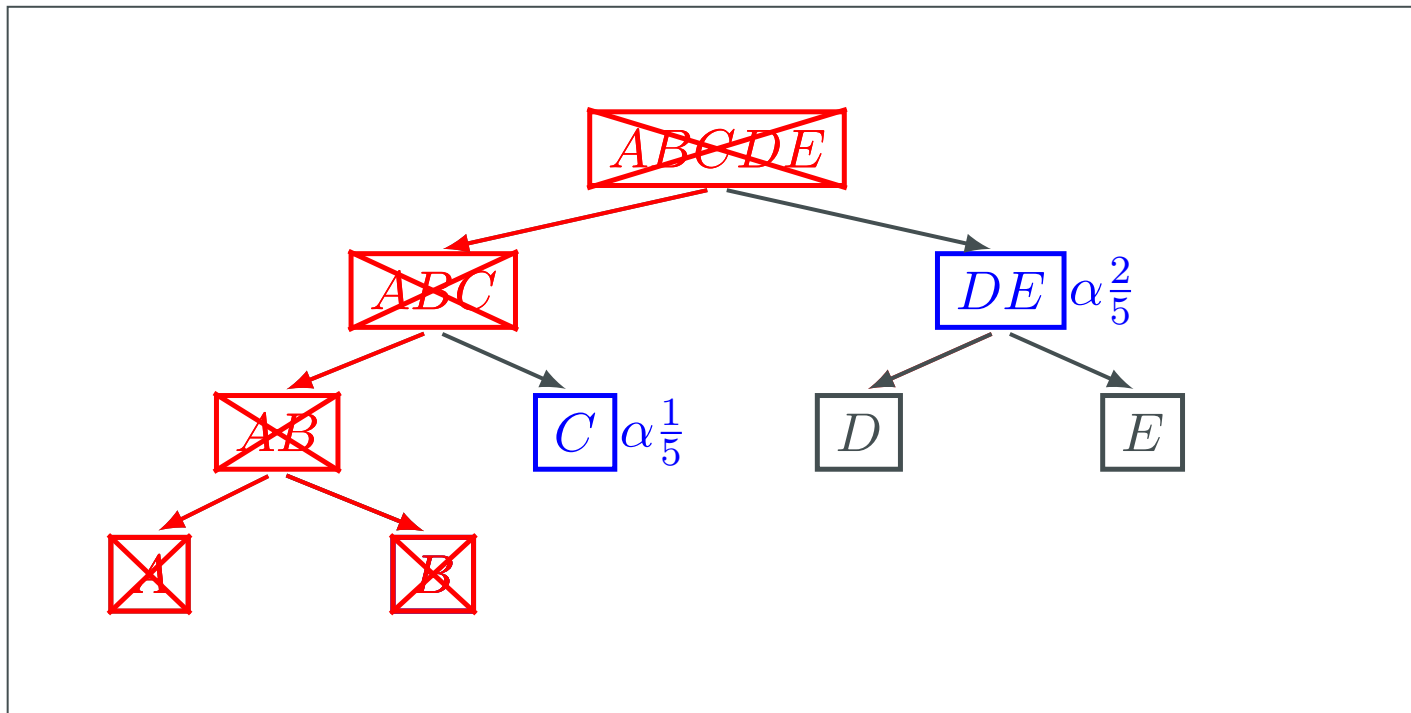

Meinshausen's procedure (BMK 2008)

Shaffer's improvement: if $A \cap B$ is a correct rejection, at least one hypothesis is false: test A and B at level $\frac{2}{5}\alpha$

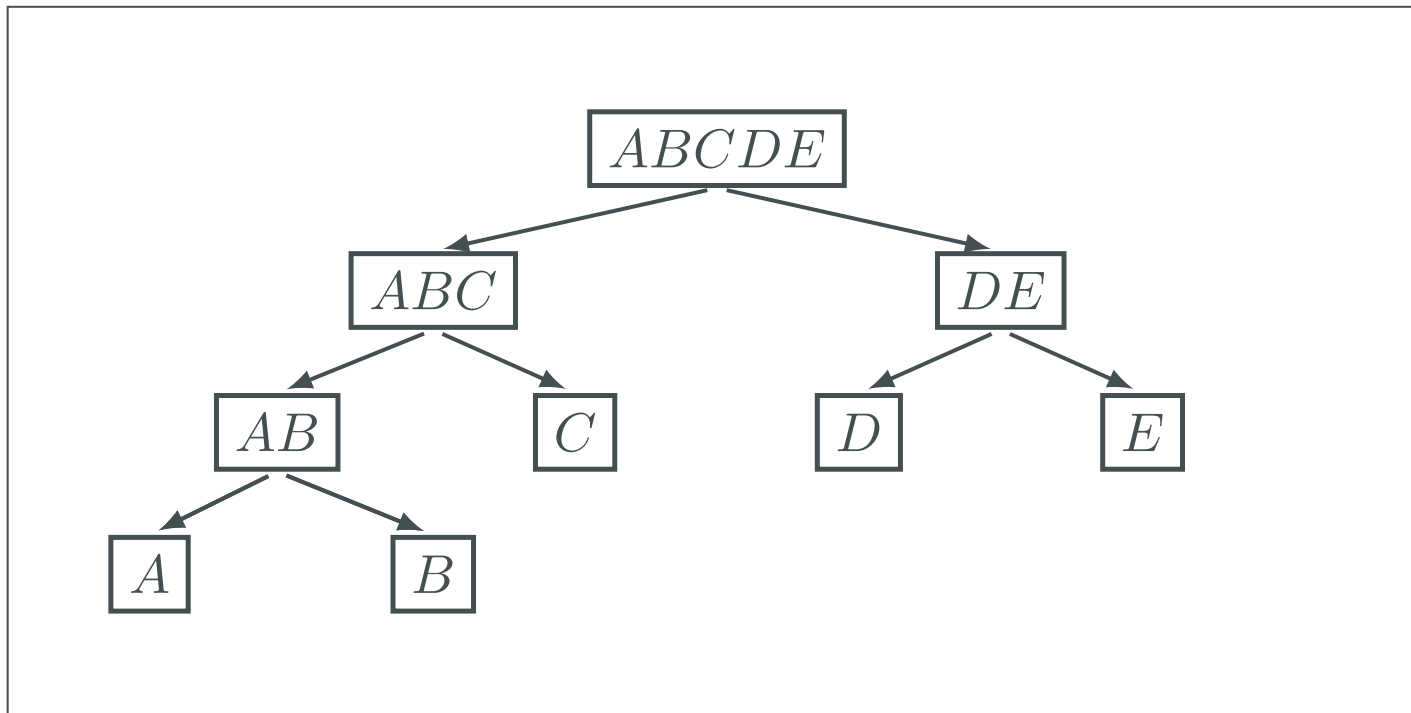

Meinshausen's procedure (BMK 2008)

reject A and B.
STOP!

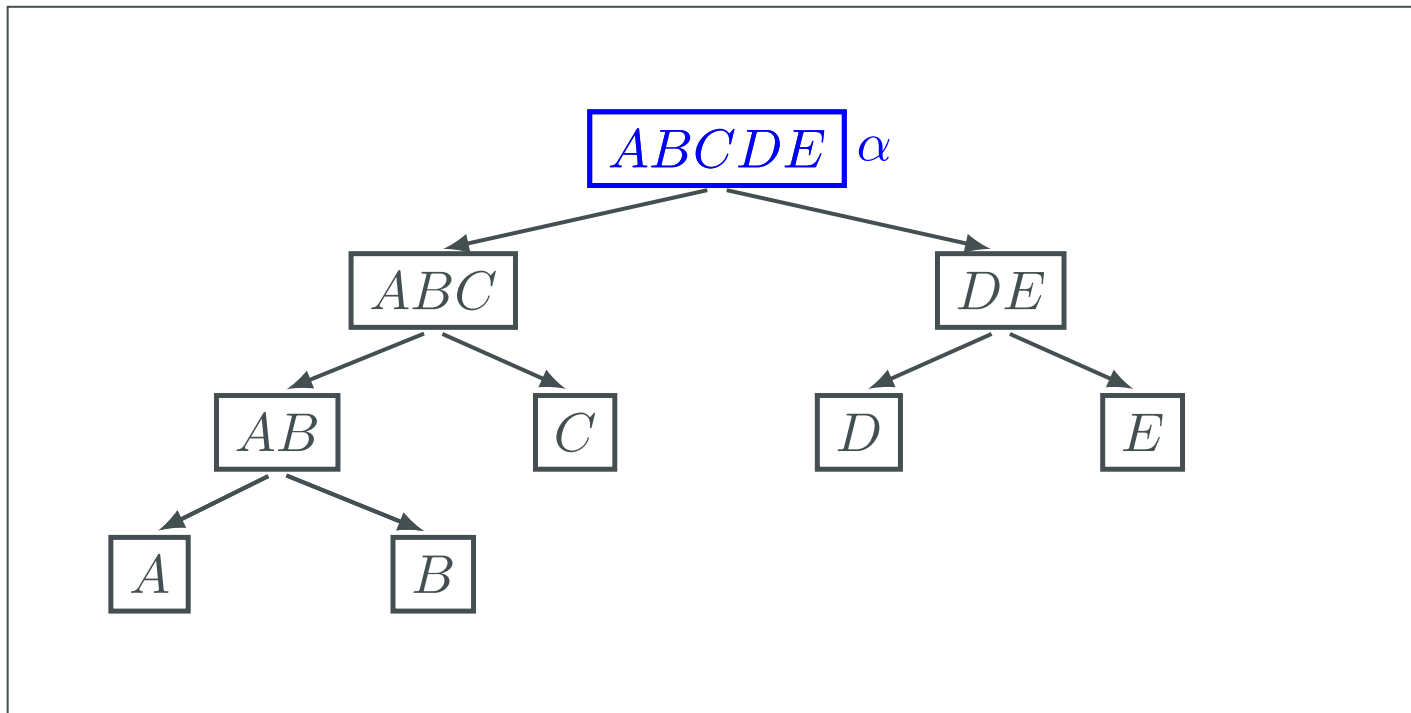

Inheritance procedure (Goeman & Finos 2009)

Perform Meinshausen's procedure

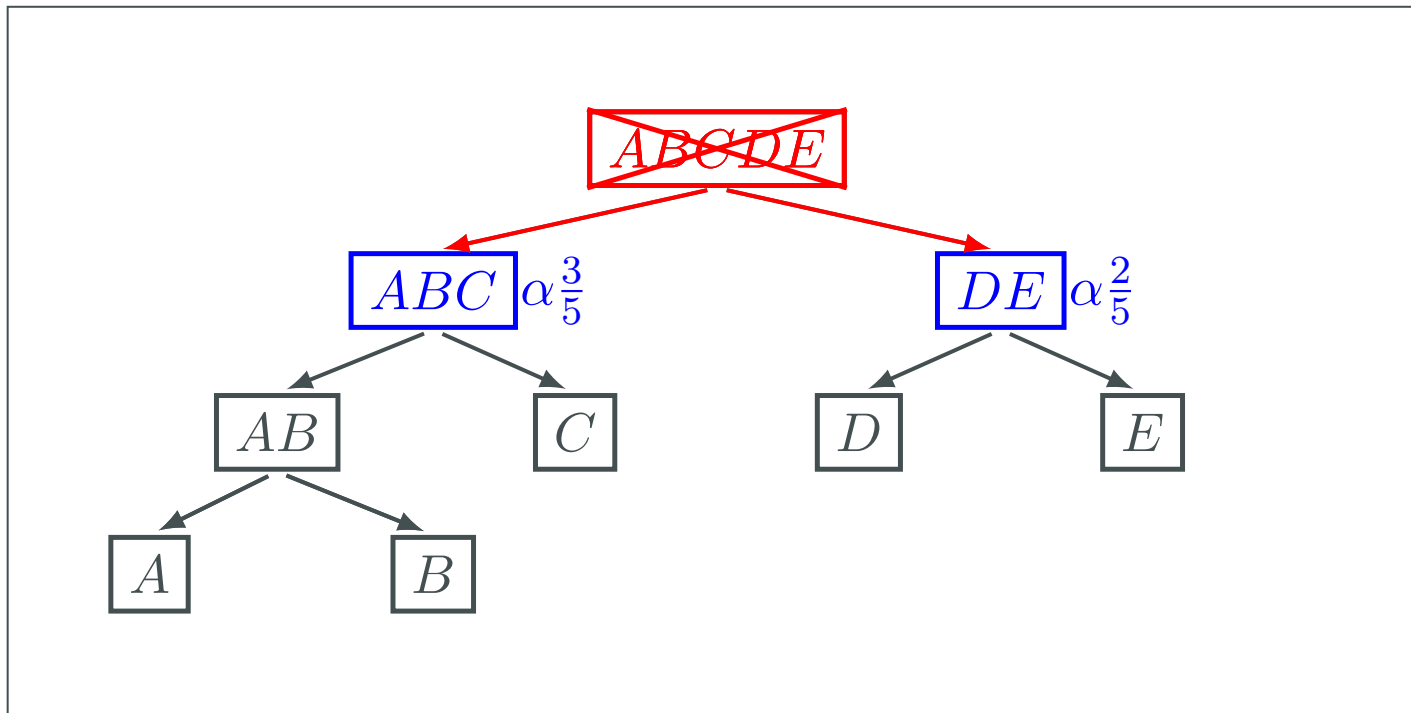

Inheritance procedure (Goeman & Finos 2009)

Perform Meinshausen's procedure

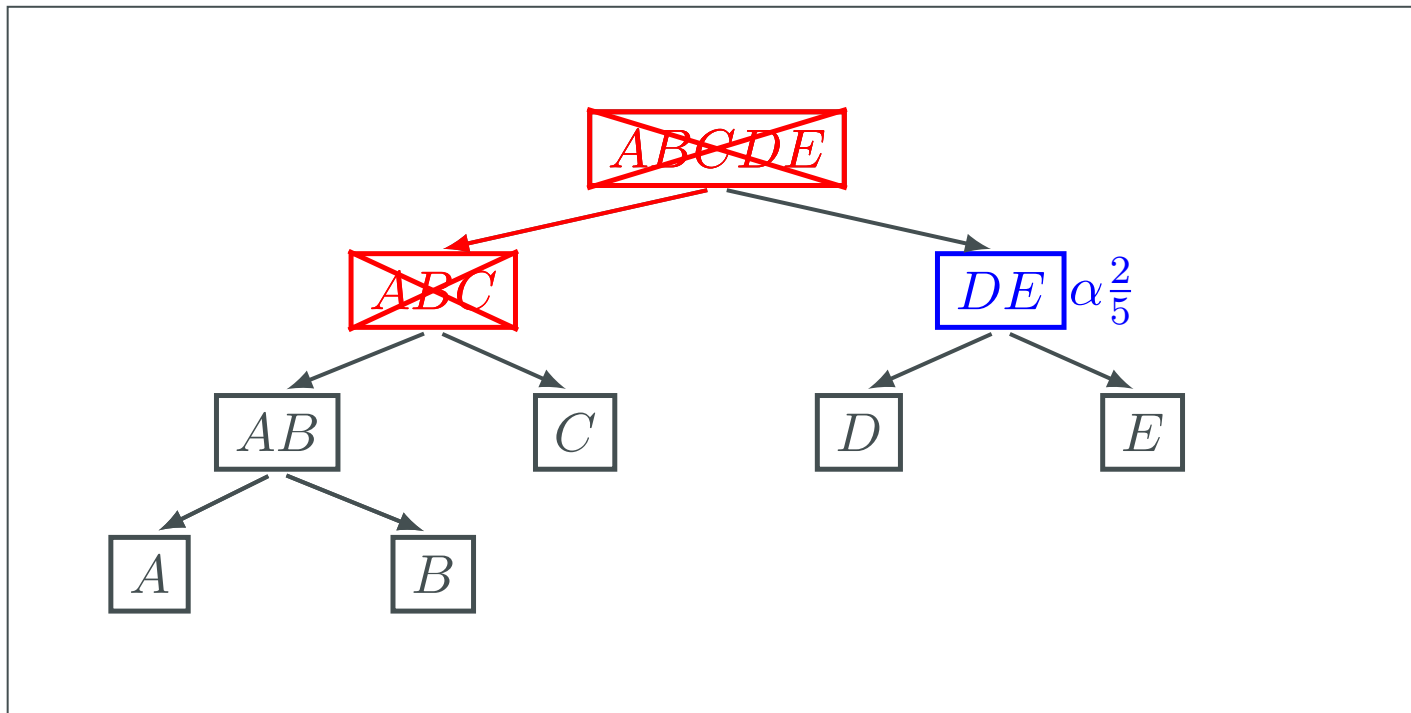

Inheritance procedure (Goeman & Finos 2009)

Perform Meinshausen's procedure

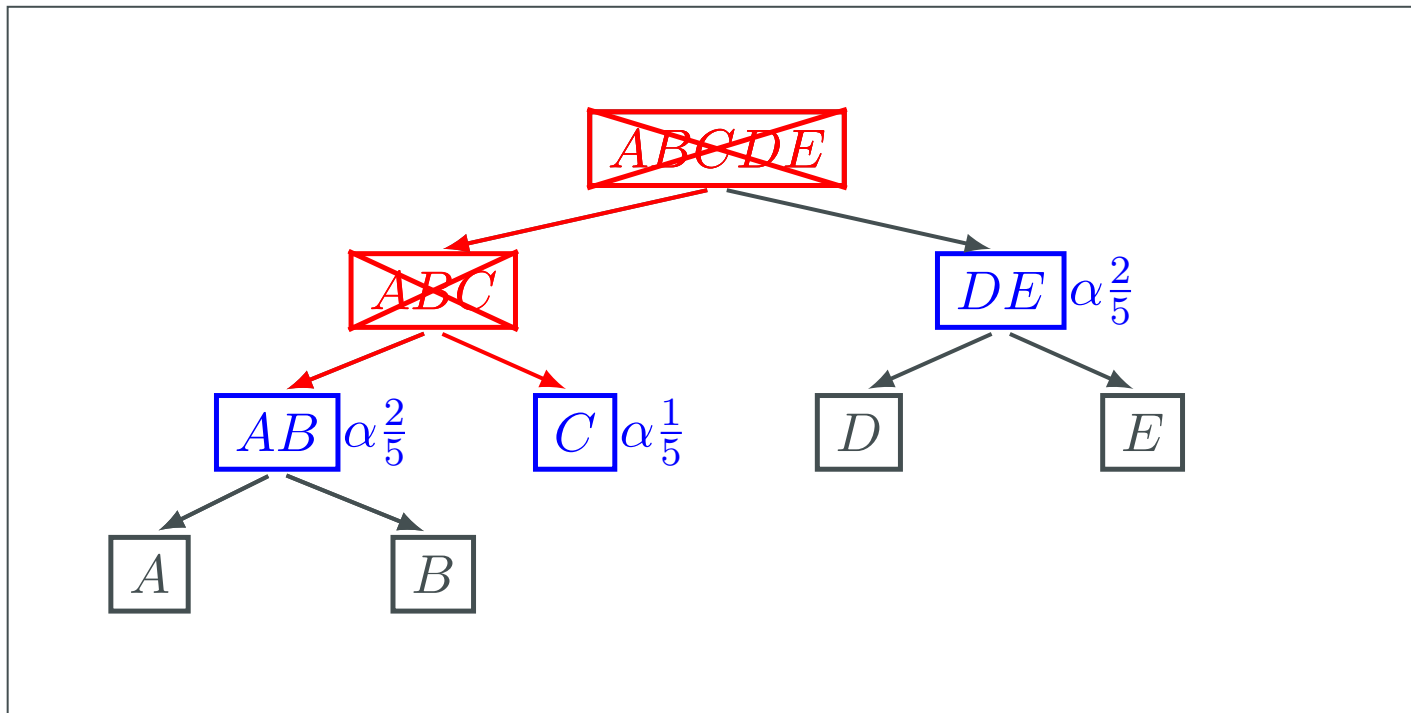

Inheritance procedure (Goeman & Finos 2009)

Perform Meinshausen's procedure

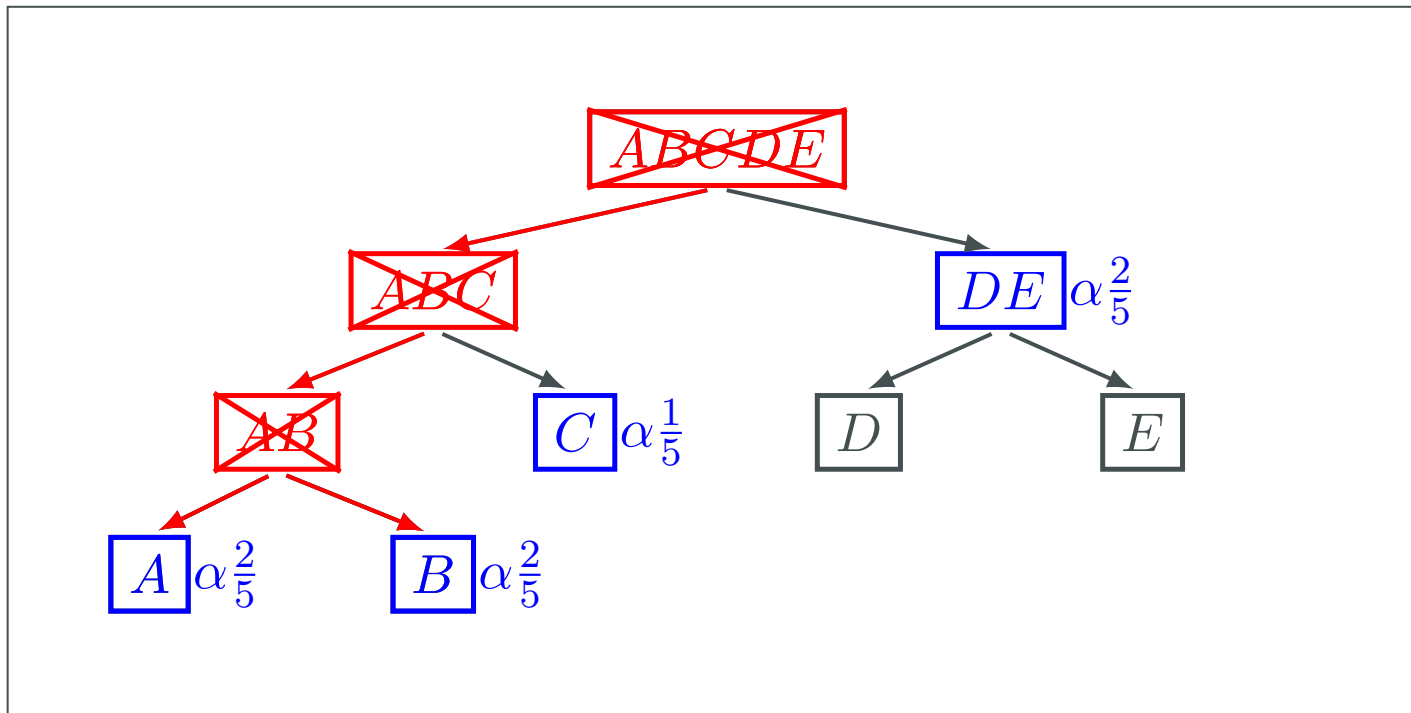

Inheritance procedure (Goeman & Finos 2009)

Perform Meinshausen's procedure

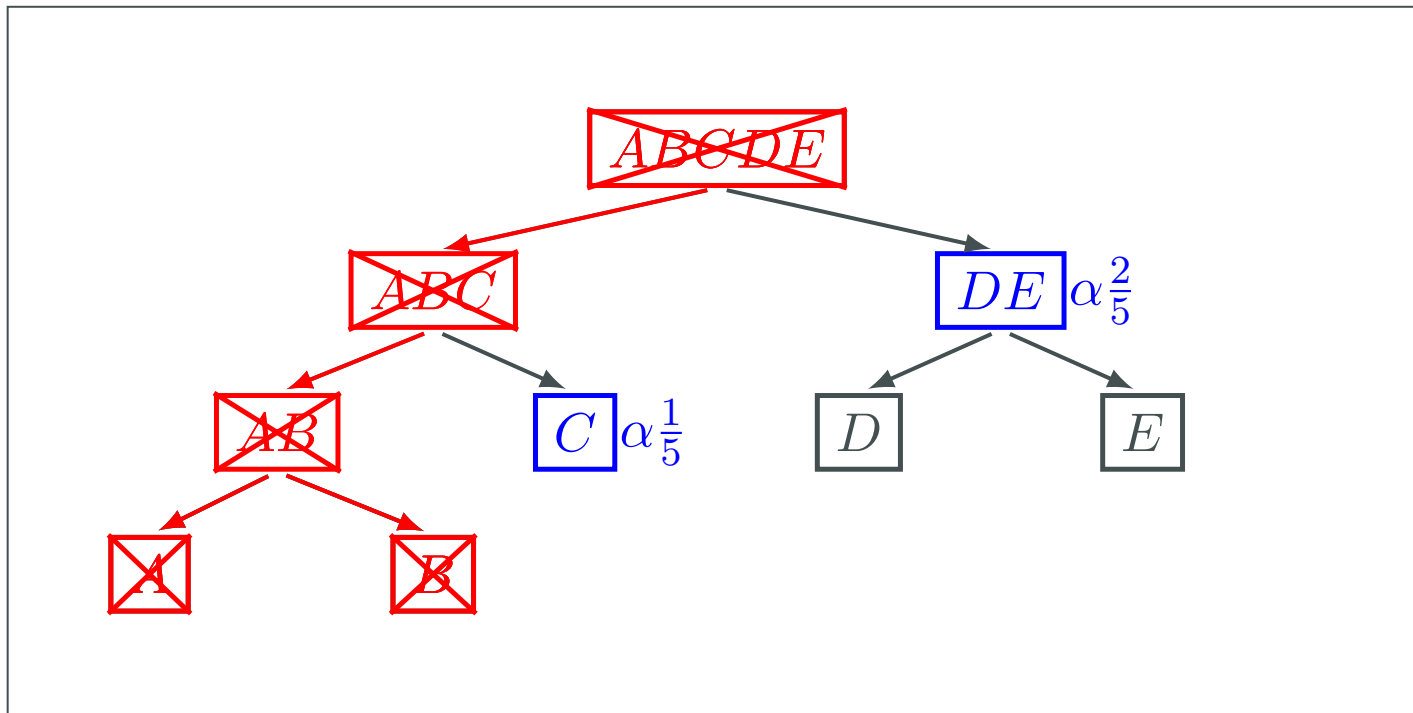

Inheritance procedure (Goeman & Finos 2009)

Perform Meinshausen's procedure

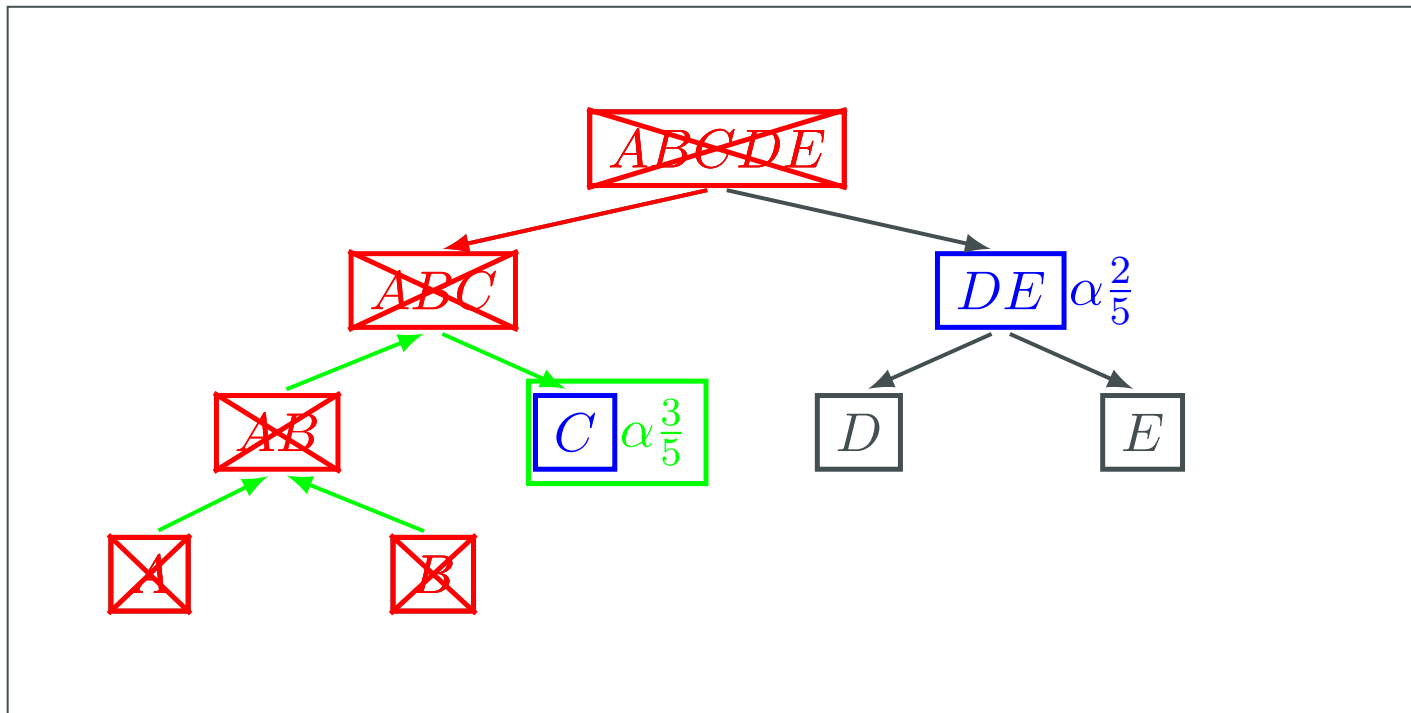

Inheritance procedure (Goeman & Finos 2009)

All leaf nodes in AB are rejected

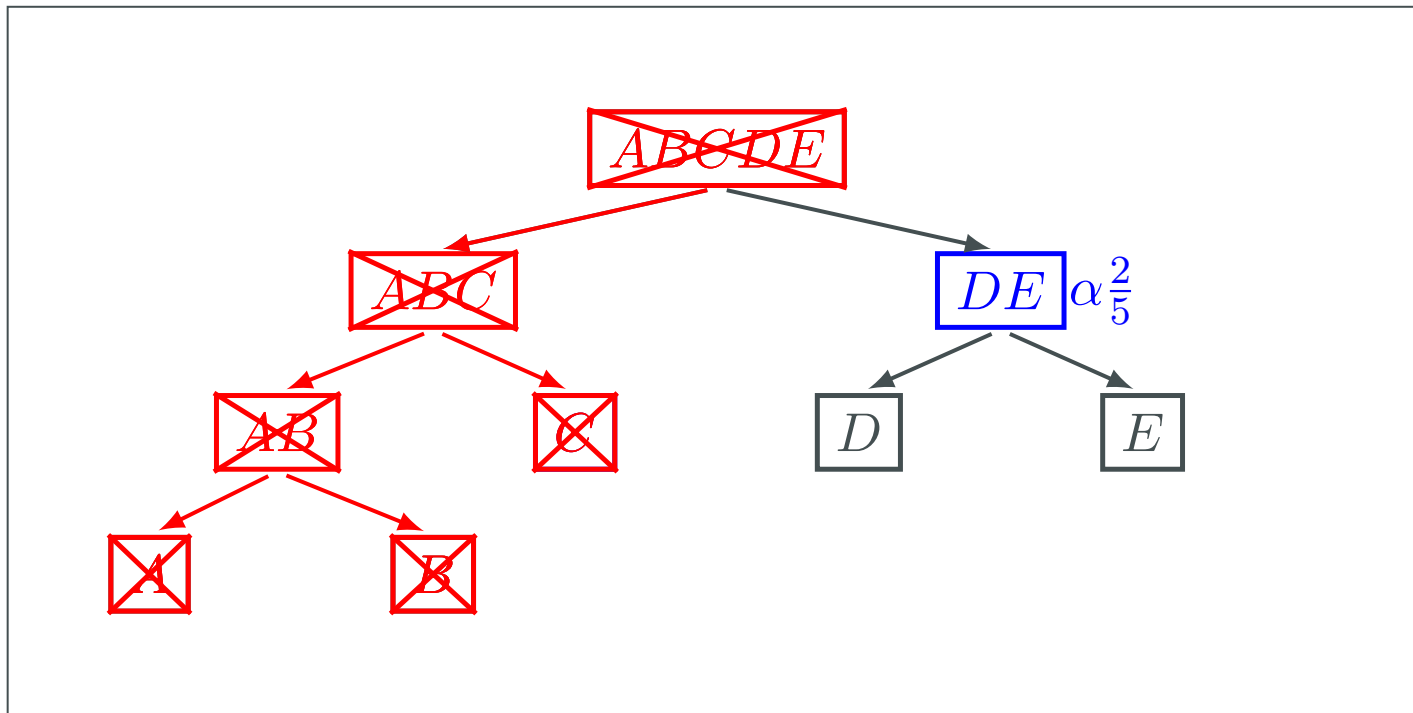

Inheritance procedure (Goeman & Finos 2009)

$\frac{2}{5}\alpha$ from AB is **inherited** to C (i.e. the closest relative)
test C at $(\frac{1}{5} + \frac{2}{5})\alpha$

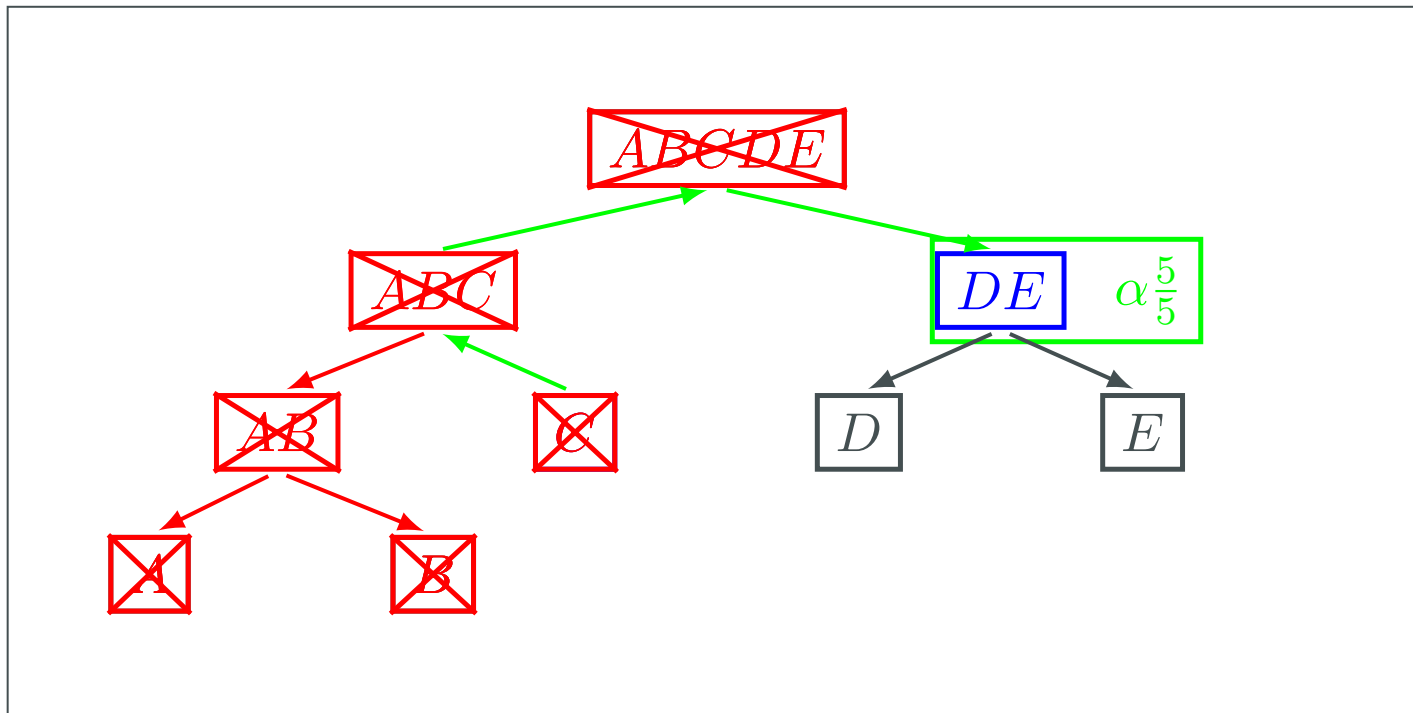

Inheritance procedure (Goeman & Finos 2009)

suppose $p_C \leq \frac{3}{5}\alpha$

Inheritance procedure (Goeman & Finos 2009)

$\frac{3}{5}\alpha$ from C is inherited to DE

Microarray-based comparative genomic hybridization (aCGH) Modena et al., 2006

Data

- 2 samples:
infratentorial tumors (14 patients) versus
supratentorial tumors (8 patients).
- chromosome 9 (147 probes)

Inference

- for each probe (univariate): two sample t-test
- The signal is very weak and sparse among probes:
Holm ($\alpha = .05$): no rejections

Results: Inheritance

Significant differences ($\alpha = .05$):

- arm: p
- band: p22.1 and p.21.3
- gene: CTD 2097k16

Software (bioconductor.org)

Inheritance procedure

R package *globaltest*

Authors: Goeman & Finos

> inheritance()
```

Neurotoxicity screening assay (FOB; Moser, 1989)

Goal: Evaluation of neurotoxic effects of perchlorethylene

Data: The United States Environmental Protection Agency published a guideline (FOB) to assess behavioural and neurologic functions in rats

- treatment (1.5g/kg exposure level) versus control (no exposure)
- 8 rats at each group
- 21 endpoints encompassing a wide spectrum of neurologic effects, grouped into 6 domains
- at each endpoint, the response is ordinal on a scale from 1 (absence of adverse effect) to 4 (most severe reaction)

Challenging statistical problem: A large number of outcomes for a small sample of subjects

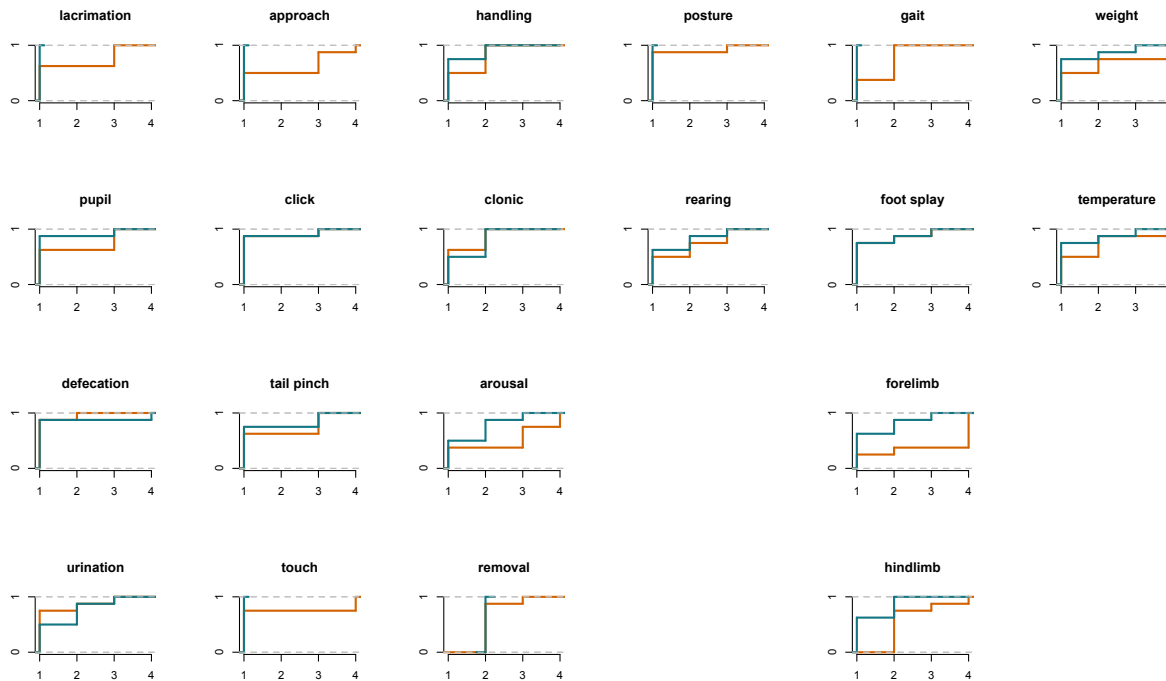

Data

Domain	Endpoint	Exposure (g/kg)							
		0 (control)				1.5 (treatment)			
		1	2	3	4	1	2	3	4
Autonomic	Lacrimation	8	0	0	0	5	0	3	0

Multiple hypotheses

$$H : Y_H \stackrel{d}{=} X_H \quad \text{versus} \quad \tilde{H} : Y_H \stackrel{\text{st}}{\geq} X_H, \quad H \in \mathcal{H}$$

Test statistics

Ordinal measurement: distances between categories are unknown

Mantel's test $S_H(\mathbf{w})$ depends on nondecreasing scores \mathbf{w} assigned to categories.

To overcome this problem, consider as the test statistic

$$S_H^{\max} = \max_{\mathbf{w}} \{S_H(\mathbf{w})\}$$

where \mathbf{w}^{\max} maximizing $S_H(\mathbf{w})$ can be found by isotonic regression (adaptive test)

Arousal	I	II	III	IV	
1.5 g/kg	2	1	3	2	8
0 g/kg	5	2	1	0	8

$$\mathbf{w}^{\text{es}} = (0, 1/3, 2/3, 1)$$

$$S_H(\mathbf{w}^{\text{es}}) = 2.07$$

Test statistics

Ordinal measurement: distances between categories are unknown

Mantel's test $S_H(\mathbf{w})$ depends on nondecreasing scores \mathbf{w} assigned to categories.

To overcome this problem, consider as the test statistic

$$S_H^{\max} = \max_{\mathbf{w}} \{S_H(\mathbf{w})\}$$

where \mathbf{w}^{\max} maximizing $S_H(\mathbf{w})$ can be found by isotonic regression (adaptive test)

Arousal	I	II	III	IV	
1.5 g/kg	2	1	3	2	8
0 g/kg	5	2	1	0	8

$$\mathbf{w}^{\max} = (0, 0.07, 0.65, 1)$$

$$S_H^{\max} = S_H(\mathbf{w}^{\max}) = 2.15$$

Inference

p-values for Endpoints (i.e. univariate test) are found by permutation approach (i.e. resampling based)
p-values for Domains (i.e. multivariate test) are found by combination of univariate ones (Pesarin 2001, Klingenberg et al. 2009)

Results: endpoint level

⊙ = raw p-values

Results: endpoint level

adjusted p-values: \odot = Inheritance, \times = Holm

Results: domain level

adjusted p-values: ○ = Inheritance

Take-home message

Inheritance procedure

- Allows inference on tree-structured hypotheses
- Improves Meinshausen
- Available in the R package *globaltest*

Furthermore

- Extention to general graphs
- Extention to high dimension

Take-home message

Sequential Rejection principle

- A unifying approach,
it includes other methods (Shaffer's, fallback, focus level,
Meinshausen's, Rosenbaum's, etc.)
Some other FWE controlling procedures do not fit (Sidak,
Hochberg)
- Easy-to-check conditions of FWER control
- Useful tool to formulate procedures
